

Need to deploy

1. zip the folder
2. get the zipper.php
3. valid database sql

STEPS To host a website:

1. open webhost and signup if already account then login
2. go to file manager of 000webhost
3. go to your domain of 000webhost
4. unzip the project
5. move all files to /. this directory
6. delete previous **public_html** File
7. set the **public** file or rename public file to **public_html** and
8. Open

->**app->provider->appserviceprovider**

And paste the register code to

```
$this->app->bind('path.public', function()  
{  
    return base_path('public_html');  
});
```

9. Open **.env** file and copy **app_key**
10. Open Folder:
->**config->edit.php**
11. Open **PHPmyadmin** create database
then create new database
12. **Import** database
13. Open **.env** file and make changes
